## 1.1 Chapter 21

- 19** Suppose that  $p(x) \in F[x]$  and  $E$  is a finite extension of  $F$ . If  $p(x)$  is irreducible over  $F$ , and  $\deg p(x)$  and  $[E : F]$  are relatively prime, show that  $p(x)$  is irreducible over  $E$ .

Let  $a$  be a zero of  $p(x)$  and let  $\deg p(x) = n$ . Because  $\{1, a, \dots, a^n\}$  is a basis for  $F(a)$  over  $F$  by Theorem 20.3  $[F(a) : F]$  is relatively prime to  $[E : F]$ . Because  $E$  is an extension of  $F$ ,  $[E(a) : E] \leq [F(a) : F]$ . Also note that

$$[E(a) : F(a)][F(a) : F] = [E(a) : F] = [E(a) : E][E : F]$$

So  $[F(a) : F]$  divides  $[E(a) : E]$  implying  $[F(a) : F] = [E(a) : E]$ , so  $a \notin E$  and  $p$  is irreducible in  $E$ .

- 24** Find a splitting field for  $x^4 - x^2 - 2$  over  $Z_3$ .

$$x^4 - x^2 - 2 = (x^2 + 1)(x^2 - 2) = (x + i)(x - i)(x + \sqrt{2})(x - \sqrt{2})$$

So  $Z_3(i, \sqrt{2})$  is a splitting field.

- 32** Let  $f(x)$  and  $g(x)$  be irreducible polynomials over a field  $F$  and let  $a$  and  $b$  belong to some extension  $E$  of  $F$ . If  $a$  is a zero of  $f(x)$  and  $b$  is a zero of  $g(x)$ , show that  $f(x)$  is irreducible over  $F(b)$  if and only if  $g(x)$  is irreducible over  $F(a)$ .

$$\begin{array}{ccccc}
 & F(a, b) & & & \\
 \textcolor{red}{x} \nearrow & & \nwarrow \textcolor{green}{y} & & \\
 F(a) & & F(b) & \Rightarrow & xa = yb \Rightarrow \begin{array}{c} g \text{ irred over } F(a) \\ \Updownarrow \\ \textcolor{red}{x} = \textcolor{red}{b} \end{array} \iff \begin{array}{c} f \text{ irred over } F(b) \\ \Updownarrow \\ \textcolor{green}{y} = \textcolor{green}{a} \end{array} \\
 a \searrow & & \nearrow b & & \\
 & F & & & 
 \end{array}$$

- 36** Suppose that  $a$  is algebraic over a field  $F$ . Show that  $a$  and  $1 + a^{-1}$  have the same degree over  $F$ .

We can see that  $1 + a^{-1} \in F(a)$  and that  $a \in F(1 + a^{-1})$ , meaning that  $F(a) = F(1 + a^{-1}) = F(a, 1 + a^{-1})$  so

$$[F(a, 1 + a^{-1}) : F] = [F(a) : F] = [F(1 + a^{-1}) : F]$$

- 42** Suppose  $K$  is an extension of  $F$  of degree  $n$ . Prove that  $K$  can be written in the form  $F(x_1, x_2, \dots, x_n)$  from some  $x_1, x_2, \dots, x_n$  in  $K$ .

*Proof.* Because  $[K : N]$  is finite  $K$  must be an algebraic extension of  $F$ . Let  $[K : N] = n$ , for all  $k \in K$

$$k = f_0 k_0 + f_1 k_1 + \dots + f_n k_n$$

Where  $f_1, \dots, f_n \in F$  and  $k_1, \dots, k_n \in K$  we can see that  $f_0 k_0 \in F(k_0)$ , so

$$k = f_0 k_0 + f_1 k_1 + \dots + f_n k_n \in F(k_0)(k_1) \dots (k_n) = F(k_0, k_1, \dots, k_n)$$

□

## 1.2 Chapter 22

- 18** Suppose that  $[E : Q] = 2$ . Show that there is an integer  $d$  such that  $E = Q(\sqrt{d})$  where  $d$  is not divisible by the square of any primes. Let  $d = -1$ . We can see that  $\{1, i\}$  is a basis for  $Q(i)$  over  $Q$ .
- 24** Show that any finite subgroup of the multiplicative group of a field is cyclic.
- 37** Let  $E$  be the splitting field of  $f(x) = x^{p^n} - x$  over  $Z_p$ . Show that the set of zeros of  $f(x)$  in  $E$  is closed under addition, subtraction, multiplication, and division (by nonzero elements). (This exercise is referred to in the proof of Theorem 22.1)
